Title of the Talk

Zhou Zhengyang
Psychology, the Chinese University of Hong Kong

The article that I prepare to share with you presents a neural account of what drives us to share information with one another. The researchers focused on online news as one form of sharing that has the potential for widespread impact. The study tested whether decisions to select and share articles are associated with greater activity in neural regions involved in subjective value, self-related processing, and taking the perspective of others and suggested that human biology may have evolved to support the motivation to share and social coordination.

About the speaker

Hi, I am Zhou Zhengyang, a first-year undergraduate student studying psychology at CUHK. This is my first time doing an academic article sharing and I'm excited to learn more about cognitive science. I am interested in finding out more about the neural/biological basis of human social activities. Feel free to talk to me or ask me anything!
